

BAB V

KESIMPULAN DAN SARAN

5.1 Kesimpulan

Berdasarkan penelitian yang telah dilakukan, dapat disimpulkan bahwa:

1. Pada koagulasi limbah cair sintetik merah, peningkatan dosis galaktomanan sebagai bahan pembantu koagulan meningkatkan persentase pengurangan zat warna dan volume *sludge* yang terbentuk. Semakin banyak dosis galaktomanan yang diberikan, semakin banyak pula rantai karbon galaktomanan yang dapat mendestabilisasi koloid melalui adsorpsi dengan pembentukan jembatan. Namun, terdapat titik kritis saat penambahan dosis galaktomanan tidak meningkatkan aktivitas koagulasi. Dosis terbaik yang diperoleh adalah 80 mg/L dengan pengurangan zat warna 42,6% dan volume *sludge* yang dihasilkan sebanyak 11 mL/L.
2. Variasi konsentrasi zat warna kongo merah pada proses koagulasi menghasilkan profil pengurangan zat warna dan volume *sludge* yang sama. Pengurangan zat warna dan volume *sludge* tertinggi diperoleh pada penggunaan konsentrasi zat warna yang paling rendah yaitu 20 ppm, karena sisi aktif koagulan tersedia lebih banyak untuk mengadsorp partikel zat warna. Jika dibandingkan dengan penggunaan koagulan FeCl₃ saja, penambahan galaktomanan ampas kopi berhasil meningkatkan persentase pengurangan zat warna dan volume *sludge* dari 68,8% dan 12,2 mL menjadi 88,9% dengan volume *sludge* 33 mL/L.

5.2 Saran

Saran yang dapat diberikan untuk penelitian selanjunya adalah:

1. Perlu adanya analisis lebih lanjut untuk mengkonfirmasi senyawa galaktomanan hasil ekstrak ampas bubuk kopi, misalnya analisis *HPLC*.
2. Pemilihan kondisi yang lebih bervariasi diperlukan untuk mengetahui variabel yang mempengaruhi kinerja galaktomanan, misalnya seperti variasi pH.
3. Perubahan rentang percobaan koagulasi perlu diperkecil untuk memperoleh kondisi paling optimum dan hasil yang lebih valid.
