

BAB 5

KESIMPULAN DAN SARAN

5.1 Kesimpulan

Kesimpulan yang dapat diambil dari penelitian ini:

1. Penggunaan asam akrilat, inisiator kalium persulfat, *crosslinker* CaCl_2 , *plasticizer* gliserin, dan *foaming agent* NaHCO_3 menghasilkan polimer yang berbentuk gel dan terdapat gelembung kecil di dalamnya.
2. Penambahan volume asam akrilat dapat meningkatkan daya serap air.
3. Pencucian polimer dengan aseton meningkatkan daya serap air.
4. Biopolimer berongga memiliki daya serap tertinggi sebesar 30,08 g air/g polimer pada perbandingan mol pati : mol AA = 1 : 2 dan dilakukan pencucian dengan aseton.

5.2 Saran

Penelitian ini masih perlu dikembangkan lagi untuk dapat membuat polimer berbahan dasar pati ganyong yang memiliki daya serap yang tinggi. Pemilihan bahan seperti *foaming agent* perlu diteliti lebih lanjut, serta cara pengeringan polimer yang baik sehingga polimer tidak mudah hancur setelah dikeringkan. Perlu ada analisis morfologi menggunakan *X-ray Microscope* atau SEM untuk melihat rongga dan pori dalam polimer
